

6 Ways a Preventative Maintenance Visit can Boost your Bottom Line

- 1.** When equipment has been unused for extended periods or used intermittently, such as during a lockdown period, a PMV visit can make sure any small issues are dealt with and systems are ready for use. This ensures productivity from the outset when the workforce is back.
- 2.** Thorough system checks and cleaning are proven to extend the working life of the equipment and keep it in good working order. Improved reliability and a longer life for your equipment lessens expensive outlay.
- 3.** Proactive maintenance helps ensure any potential issues are overcome before they become a problem, preventing downtime and any potential loss of revenue through equipment failure.
- 4.** Experiencing a problem with your technology while meeting with clients, even remotely, can create a bad impression, risking important deals and costing time and money.
- 5.** Asset management is an element of the Preventative Maintenance process that will keep track of your Audio Visual assets. This is important, as over time equipment can get moved or misplaced, which can be both inconvenient and costly. Tracking your assets reduces these risks.
- 6.** During a Preventative Maintenance Visit, the service team will identify any equipment nearing the end of its serviceable life. Preparing and managing product obsolescence helps cash flow, by allowing time to budget for new equipment while reducing the risk of equipment failure and downtime.

A study by the Department of Energy estimates that preventive maintenance results in:

What is a Preventative Maintenance Visit (PMV)?

This is a proactive, technically focussed visit from one of our engineers, concentrating on all aspects of your Audio Visual, IT, unified communication, control and intercom systems. During a PMV, our technical service team will install the latest updates, check the system is performing correctly, clean hardware, check all cables and connectors and carry out a full functionality check. They will also update the asset register. We recommend two PMVs a year for optimum performance. For safety, our engineers are provided with protective face masks, gloves and sanitiser.

Enjoy a free full AV system health check by a qualified Smartcomm Engineer. Simply contact us before the end of March 2021 to make a booking for any time in 2021.

*1/2 day maximum. New Service & Support clients only. Limited to 1 per customer.
